

IBX BOOST GEL APPLICATION

- Shape the free edge.
 - Gently push back cuticles making sure there is no cuticle left on the nail plate.
 - Cleanse nails with Cinnatize scrubbing the nail plate.
- Avoiding contact with the skin, apply an **extremely thin** coat of **IBX BOOST** Base using a scrubbing motion and light pressure to work the product into the nail plate and cap the free edge.
- Cure in a UV or LED lamp for one minute. Do not cleanse.
- Apply a **THIN** coat of **IBX BOOST** Gel to the nail plate and glide the product over the entire nail (just like nail polish), capping the free edge. Allow the product to self level.
- Cure in a UV or LED lamp for one minute.
- We recommend a second **THIN** coat of **IBX BOOST** Gel applied the same as the first. Do not cleanse before this coat.

- For a natural look we recommend finishing the service with a gel top coat to protect your **IBX BOOST** application. **IBX BOOST** can also be applied under gel polish, soak-off and hard gels.

If no smoothing required:

Apply gel polish/ gel directly over the sticky layer as you always do, finish with your top coat and cleanse with 90%+ IPA.

If smoothing required:

Remove sticky layer with 90%+ IPA. Lightly buff the shine, apply gel polish (base coat optional) or gel as you always do, finish with your top coat and cleanse with 90%+IPA.
